

IBM PROJECT 2022

UNIVERSITY ADMIT ELIGIBILITY PREDICTOR

PROJECT REPORT DOCUMENTATION

TEAM ID: PNT2022TMID37213

1. INTRODUCTION

1. Project Overview

Students are often worried about their chances of admission to University. The aim of this project is to help students in shortlisting universities with their profiles. The predicted output gives them a fair idea about their admission chances in a particular university. This analysis should also help students who are currently preparing or will be preparing to get a better idea.

2. Purpose

- Students often feel difficulty in shortlisting the universities to apply for which they tend to wonder if their profile matches the requirements of a certain university.
- Moreover, the cost of applying to a university is extremely high making it critical that students shortlist universities based on their profile.
- A university admission prediction system is quite useful for students to determine their chances of acceptance to a specific university.
- This system reduces dependence on educational consultancies, who charge loads of money to analyze a candidate's profile and determine the universities he/she should apply to.

2. LITERATURE SURVEY

1. Existing problem

There exists no tools or technologies for study-abroad aspirants to get their profiles evaluated for free. Hence, this Predictor aims to consider various factors involved in an application and use ML models to predict the chances of the individual.

2. References

1. [Graduate Admission Prediction Using Machine Learning](#)

Aljasmi, et. all. talk about the student admission problem which is very important in educational institutions. This paper addresses machine learning models to predict the chance of a student to be admitted to a master's program. They propose a system that will assist students to know in advance if they have a chance to get accepted. The machine learning models used are multiple linear regression, k-nearest neighbor, random forest, and Multilayer Perceptron. Experiments show that the Multilayer Perceptron model surpasses other models.

2. [HRSPCA: Hybrid recommender system for predicting college admission](#)

Ragab et.all., present a new college admission system using hybrid recommender based on data mining techniques and knowledge discovery rules, for tackling college admissions prediction problems. This is due to the huge numbers of students required to attend university colleges every year. The proposed HRSPCA system consists of two cascaded hybrid recommenders working together with the help of college predictor, for achieving high performance.

3. [University Admissions Predictor Using Logistic Regression](#)

Fathiya and Sadath perform a novel study on a predictor for university admissions that allows students to assess their chances of being admitted to an institution. Real student data is gathered in order to construct this. The information is kept in the form of a training set that may be used by the logistic regression classifier that was designed to predict admissions.

4. [A Machine Learning Approach for Graduate Admission Prediction](#)

AlGhamdi et.al., evaluate three learning strategies of regression to predict the university rate given the students' profile; namely, linear regression, decision tree, and logistic regression model. This paper evaluates these models to select the best model in terms of the highest accuracy rate and the least error. It was determined that the Logistic Regression model shows the most accurate prediction and hence this model was employed to predict the future applicant's university chance of admission.

3. Problem Statement Definition

Concerns about getting into college are common among students. This project's goal is to assist students in narrowing down institutions based on their profiles. The anticipated results offer them a good indication of their prospects of admission to a particular university. This analysis ought to provide better insight for students who are or will be preparing for exams.

3. IDEATION & PROPOSED SOLUTION

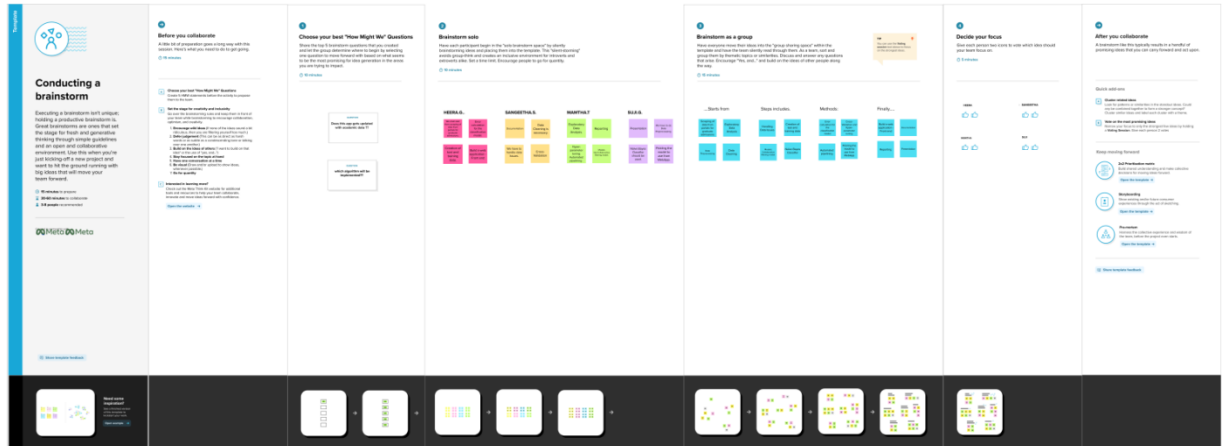

1. Empathy Map Canvas

The below figure represents the Empathy Map of the project.

2. Ideation & Brainstorming

The below figure represents the Ideation & Brainstorming image of the project

3. Proposed Solution

The below table represents the Proposed Solution.

S.No	Parameter	Description
1.	Problem Statement (Problem to be solved)	Students are often worried about their chances of admission to university. The aim of this project is to help students in shortlisting universities with their profiles. The predicted output gives them a fair idea about their admission chances in a particular university. This analysis should also help students who are currently preparing or will be preparing to get a better idea. It also aims to make a direct connection between the students and the universities and avoid any intermediaries.

2.	Idea / Solution description	<p>This project intends to calculate the probability of acceptance in a particular grad-school after assessing the candidate's profile.</p> <p>The key attributes that will be considered for making the decisions are:</p> <ul style="list-style-type: none"> i) GRE & TOEFL Scores ii) Undergrad CGPA iii) SOP & LOR iv) Corporate Work Experience / Research Experience v) Extracurriculars <p>For determining the % of acceptance, we will be using various ML models such as Logistic Regression, Multiple Linear Regression, Decision Tree & Random Forest and assess which model gives the highest accuracy with the help of performance metrics like accuracyscore, precision and recall.</p>
3.	Novelty / Uniqueness	<ul style="list-style-type: none"> ● We intend to develop a novel deep learningbased hybrid model that has a better accuracy than the existing traditional ML models. ● The web-site will also provide feedback on the parameters where the candidate is lacking so that he can improve on those areas.

.	Social Impact / Customer Satisfaction	<ul style="list-style-type: none"> ● Students often feel difficult in shortlisting the universities to apply which they tend to wonder if their profile matches the requirement of a certain university. ● Moreover, the cost of applying to a university is extremely high making it critical that students shortlist universities based on their profile. ● A university admission prediction system is quite useful for students to determine their chances of acceptance to a specific university. ● This system reduces dependence on educational consultancies, who charge loads of money to analyse a candidate's profile and determine the universities he/she should apply to.
5.	Business Model (Revenue Model)	<ul style="list-style-type: none"> ● Advertisements of different universities could be placed in the web-site to generate revenue through ads. ● In the future, a separate premium plan could be created where the students can directly interact with the professors and alumni of the university through video calls.

6.	Scalability of the Solution	<ul style="list-style-type: none"> ● A future update could have chat space where candidates, faculties, current students of the university and alumni can interact and candidates can get their doubts resolved instantly. ● To deal with huge volumes of data in the future (Both - applicants and university details), cloud-based storages (IBM cloud, AWS, GCP, AZURE) and NoSQL databases (MongoDB, Redis, etc.) could be used instead of the traditional RDBMS storage. ● Alternatively, distributed big-data processing techniques could be explored if the no. of users using the website increase exponentially during the course of time.

4. Problem Solution fit

The below images represent the Problem Solution Fit of the project

Project Title: Univesity Admit Eligibility Prediction

Project Design Phase-I - Solution Fit Template

Team ID: PNT2022TMID372

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) Who is your customer? i.e. working parents of 0-5 y.o. kids Students who just finished high school and want to get enter in a good college.	6. CUSTOMER CONSTRAINTS What constraints prevent your customers from taking action or limit choices of solutions? i.e. spending power, budget, no cash, network connection, available devices. Customers could be hesitant to use the prediction because they doubt its accuracy independability.	5. AVAILABLE SOLUTIONS Which solutions are available to the customers when they face the problem We have to include the data like percent 10 th marks and 12 th marks, medium to studies extra Extra certificates you needed.	Explore AS, differentiate
	2. JOBS-TO-BE-DONE / PROBLEMS Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one; explore different sides. Since gathering student data is plays the vital role for predicting the score. The most important student data security and they have to accept the model.	9. PROBLEM ROOT CAUSE What is the real reason that this problem exists? What is the back story behind the need to do this job? i.e. customers have to do it because of the change in regulations. If the obtained data is not enough for prediction we may not predict the eligibility to enter the college . Others things is if they data are not in secured environment the feel it is unsafe.	7. BEHAVIOUR i.e. directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace) Accuracy of prediction is a good behavior.	
Focus on J&P, tap into BE, understand RC				Focus on J&P, tap into BE, understand RC

REQUIREMENT ANALYSIS

1. Functional requirement

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	A user Interface where the candidate enters his details for determining his chances of admit.	A user Interface where the candidate enters his details for determining his chances of admit.
FR-2	Univariate Analysis	Graphical visualization of the different attributes - count plot, dist plot etc.
FR-3	Model Building	Compare and determine which regression model has the best performance.
FR-4	Deployment of ML model to IBM cloud.	Push the notebook and CSV files as an asset in deployment space and deploy the model in IBM Watson.
FR-5	Access the model as a scorable endpoint	Access the deployed model as an API in the Streamlit website using the API key generated.
FR-6	Hosting the web site in public cloud.	Host the web site in Streamlit's cloud platform.
FR-7	CI-CD pipeline	Link the repo & branch to Streamlit's cloud hosting platform to setup CI-CD pipeline.

2. Non-Functional requirements

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	A logical interface is required to make the system easy to use and to speed up typical processes. The mistake rate of users providing their information on the checkout page must not exceed 10%.
NFR-2	Security	Authorization access scenarios and definitions, as well as student record handover processes between universities. Utilize certain cryptographic techniques. When the application is validating the user or licence, communication must be limited.
NFR-3	Reliability	Data corruption is avoided by employing backup methods and strategies. At the moment of input, all data stored for user variables will be committed to the database.
NFR-4	Performance	The availability results of the requested college should be supplied to the student in little more than two seconds, and data retrieval should be trustworthy because each student will be granted a maximum of 10
		minutes, accessing the database
NFR-5	Availability	The system should be available at all times, allowing the user easy access. If the hardware or database fails, a substitute page will be displayed, and the database should be obtained from the data folder.

NFR-6	Scalability	Determines the highest workloads under which the system will still run satisfactorily. Deals with the measurement of the system's reaction time under varied load circumstances.
-------	-------------	---

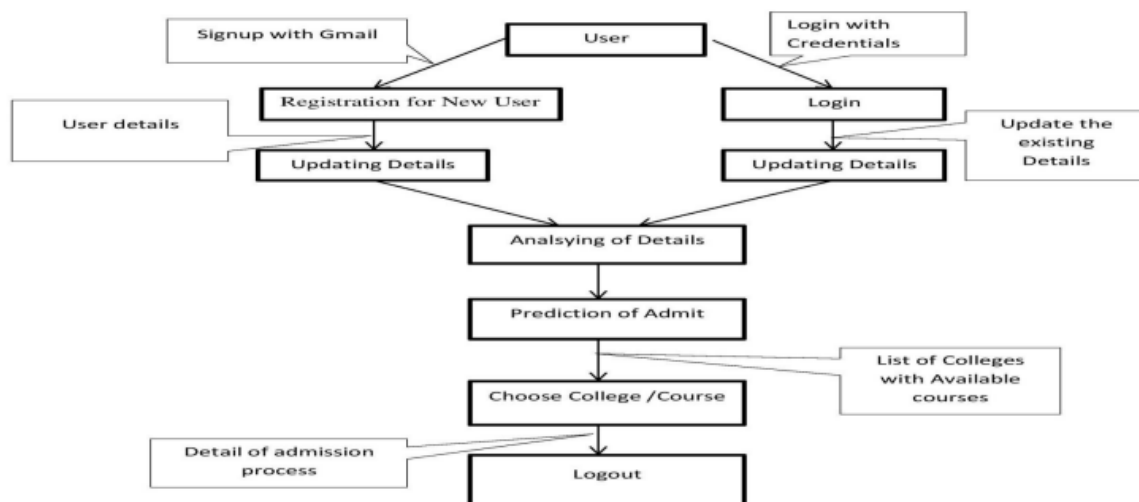

5. PROJECT DESIGN

1. Data Flow Diagrams

Project Design Phase-II Data Flow Diagram & User Stories

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

User Stories

The below template to list all the user stories for the product.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer (Web user)	Registration	USN-1	As a User can register for the application by entering my email, password, and confirming my password.	I can access my account / dashboard	High	Sprint-1
		USN-2	As a user, I will receive confirmation email once I have registered for the application	I can receive confirmation email & click confirm	High	Sprint-1
		USN-3	As a user, I can register to the application through Gmail	I can access my account	Medium	Sprint-1
	Login	USN-4	As a user, I can log into the application by entering email & password	I can access my account	High	Sprint-1
	Update Profile	USN-5	As a user, after logging in, I will have to update my profile by providing all the required details.	I can complete the profile to proceed with the prediction process.	High	Sprint-2
	Choose University	USN-6	As a user, I will be able to view the list of Universities that the students are eligible to apply.	I can choose the University from the List of University provided in the drop down menu.	High	Sprint-3
	Choose Course	USN-7	As a user, I will be able to view the list of courses that the students are eligible to apply.	I can choose the course from the List of courses provided in the drop down menu.	Medium	Sprint-3
	Admission Process	USN-8	As a user, I will be able to view the details of Admission process like date and venue of certification verification.	I can view the details of Admission process being displayed at the end of prediction.	Low	Sprint-4

	Choose Course	USN-7	As a user, I will be able to view the list of courses that the students are eligible to apply.	I can choose the course from the List of courses provided in the drop down menu.	Medium	Sprint-3
	Admission Process	USN-8	As a user, I will be able to view the details of Admission process like date and venue of certification verification.	I can view the details of Admission process being displayed at the end of prediction.	Low	Sprint-4
Administrator	Authentication	USN-9	As a admin, the login credential of the user is authenticated my me.	I can retrieve and make use of all the user details.	High	Sprint-1
	Update Profile	USN-10	As a admin, I can verify the user entered details.	I can confirm and access the user details.	High	Sprint-2
	Prediction	USN-11	As a admin, I can test the trained ML	I can test the user data	High	Sprint-3
			model by analysing the user details by ML algorithms like Logistic Regression.	with the trained ML model.		
	Output	USN-12	As a admin, I can upload the confirmation of user for the prediction into the Database.	I can keep track of user data and activities by storing in database.	High	Sprint-4

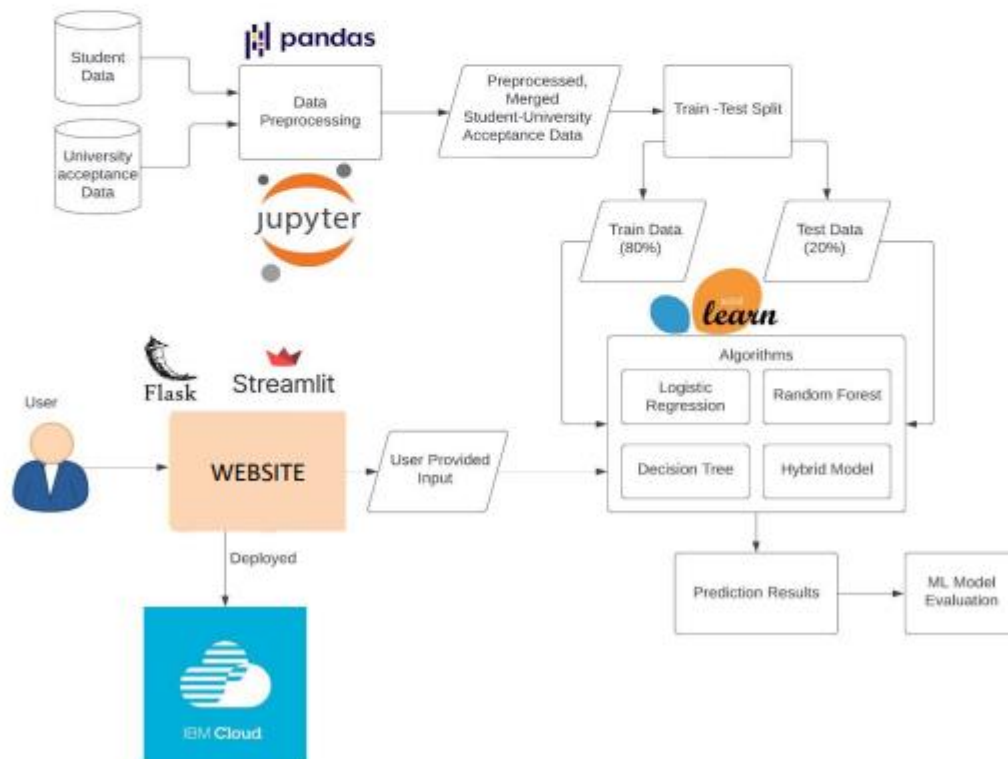

2. Solution & Technical Architecture

The below figure represents the Solution & Technical Architecture of the project

Technical Architecture

Date	18 October 2022
Team ID	PNT2022TMID37213
Project Name	University Admit Eligibility Predictor
Maximum Marks	4 Marks

System Architecture Diagram:

3. User Stories

This section contains the Project Components & Technologies, and Application Characteristics.

Table-1: Components & Technologies

SNO.	Component	Description	Technology
1.	User Interface	The Front-end part of the application for accepting user data.	Flask, Streamlit
2.	Dataset pre-processing	Removing inconsistencies in the dataset.	Pandas, Numpy, Python
3.	Application Logic	The core business logic of the application.	Python
4.	Database	For storing student & university details.	MySQL, IBM DB2, IBM Cloudant, etc.
5.	Data Visualization	Graphical visualization of student data, University's past acceptance trends, Heatmaps depicting the correlation of different attributes that play a crucial role in determining acceptance, etc	Matplotlib, Seaborn, Plotly
6.	File Storage	For storing the SOPs, LORs and other relevant PDF documents uploaded by the user.	IBM Cloud File Storage
7.	ML Model	Models to be used for prediction – Logistic Regression, DTree, Random Forest and a Hybrid Deep Learning based model.	Scikit-Learn
8.	Performance Metrics	Accuracy of the ML model on the trained and tested data.	Root Mean Squared Logarithmic Error (RMSLE), Mean Squared Error (MSE)
9.	Infrastructure	Cloud Server Configuration for hosting the web app.	IBM Cloud Hosting

Table-2: Application Characteristics:

SNO.	Characteristics	Description	Technologies Used
1.	Security Implementations	Authenticating the users before making the predictions.	Cloud authentication services with modern, secure encryption schemes like SHA 256
2.	Availability	Since the web app is hosted on cloud, it can be accessed from any device, anywhere. Also, load balancing will be implemented using IBM cloud services to distribute the load across multiple servers.	IBM Cloud Hosting, IBM Load Balancer
3.	Performance	We will be implementing 4 different ML models – Logistic Regression, Decision Tree, Random Forest and a	Scikit-Learn, Root Mean Squared Logarithmic Error

		Hybrid model and then determine which model gives the highest accuracy after comparing the model-accuracy, precision and recall values.	(RMSLE), Mean Squared Error (MSE)
--	--	---	-----------------------------------

4.	Scalable Architecture	The proposed architecture is scalable even if the no. of users registering the web app increases exponentially as the system has a cloud storage for storing the pdf documents, which can easily handle many requests. Also, the possibility of the website crashing is very minimal even if the number of users increase as IBM Load balancer takes care of distributing the load across the various servers.	IBM Cloud Services
----	-----------------------	--	--------------------

6. PROJECT PLANNING & SCHEDULING

1. Sprint Planning & Estimation

The below figure represents the Sprint Planning & Estimation details.

Product Backlog, Sprint Schedule, and Estimation (4 Marks)

Use the below template to create product backlog and sprint schedule

Sprint	Functional Requirement (Epic)	User Story Number	User Story/ Task	Story Points	Priority	Team Members
Sprint-1	Exploratory Data Analysis	US1	Perform data cleaning if required and perform univariate, bivariate and multivariate analysis.	1	Low	Mamtha.T
Sprint-1	Analysis of different regression models	US2	Compare the R2 scores of different fundamental regression models like Decision Trees, Random Forest, Multiple Linear Regression, Logistic Regression, etc and determine which model has the highest R ² score.	2	Medium	Suji.G
Sprint-2	Web Site Development and model integration using pickle file	US3	Develop the web site using Streamlit predict the probability of acceptance given a test data for a candidate. Persist the model with highest R ² score as a pickle file and integrate it with the web site.	3	High	Heera.G
Sprint-3	Deploying the model in IBM cloud.	US4	Register in IBM cloud. Use IBM Watson ML service and IBM Watson Studio to deploy the Multiple Linear Regression Model. Test the deployed model with few examples.	3	High	Sangeetha.S
Sprint-4	Integrate the web site with the deployed model.	US5	Use the deployed model in IBM Watson through the scoring endpoint by making an API call with the IBM cloud API key.	2	Medium	Heera.G, Sangeetha.S
Sprint-4	Hosting the web site in Streamlit cloud platform.	US6	Connect the respective Github repo and branch to Streamlit cloud platform and set up CI-CD to automatically deploy new changes that's pushed to the repo.	1	Low	Mamtha.T, Suji.G

2. Sprint Delivery Schedule

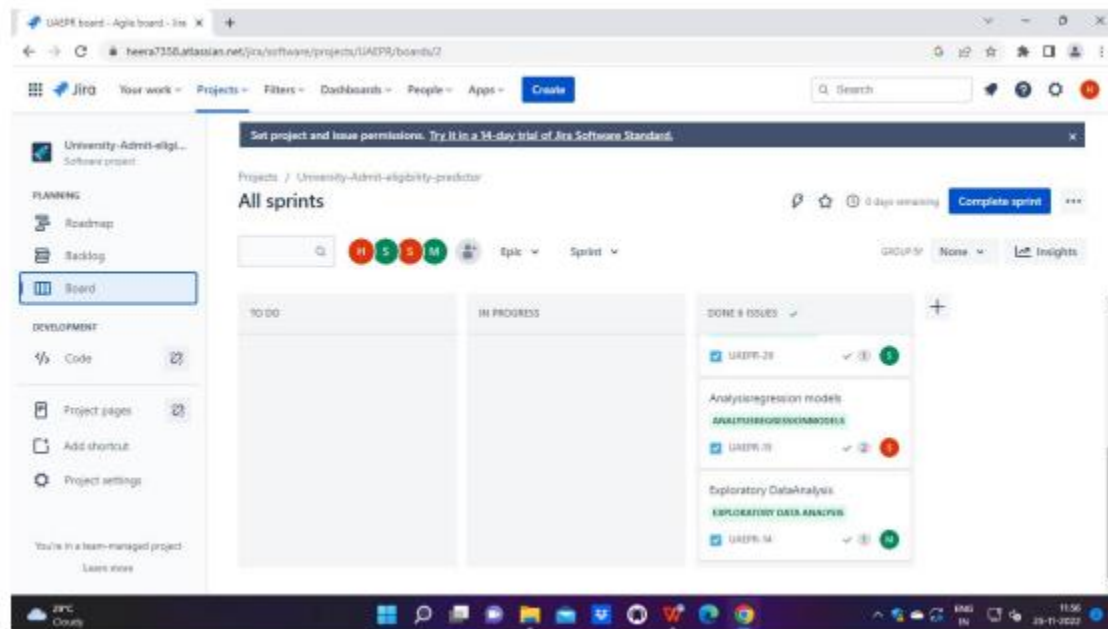

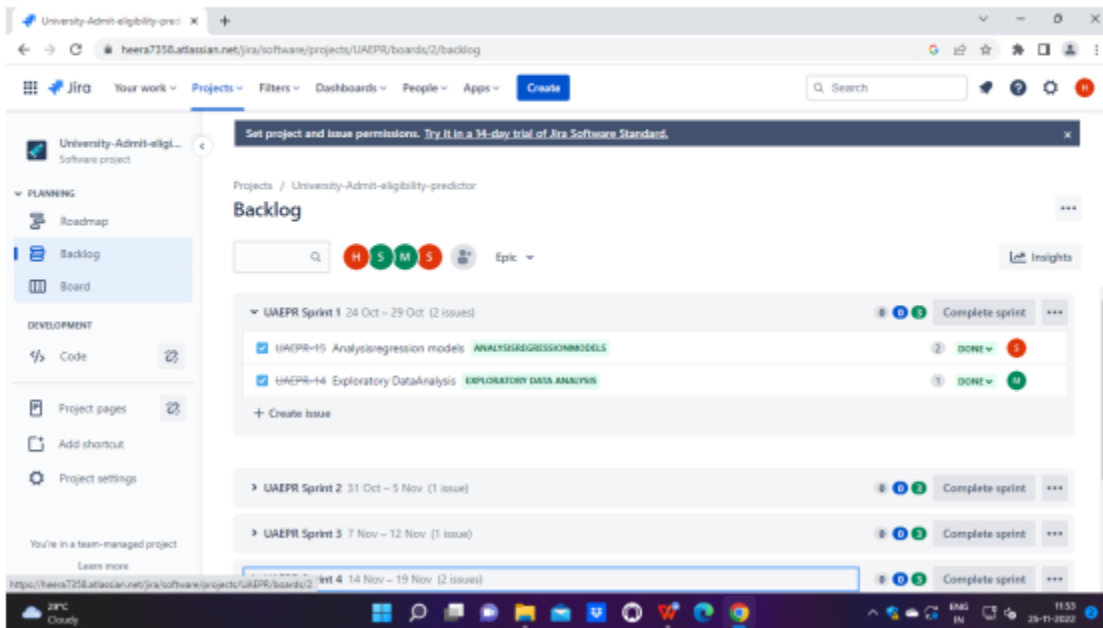

The below figure represents the Sprint Delivery Schedule details.

PROJECT TRACKER, VELOCITY & BURNDOWN CHART: (4 MARKS)

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story points completed (as on planned date)	Sprint release date (Actual)
Sprint-1	3	6 days	24 Oct 2022	29 Oct 2022	3	19 Nov 2022
Sprint-2	3	6 days	31 Oct 2022	05 Nov 2022	3	19 Nov 2022
Sprint-3	3	6 days	07 Nov 2022	12 Nov 2022	3	19 Nov 2022
Sprint-4	3	6 days	14 Nov 2022	19 Nov 2022	3	19Nov 2022

7. CODING & SOLUTIONING

1. Model Deployment in IBM Watson ML Service

In this module, we run the jupyter notebook in IBM Watson studio before deploying the model in IBM cloud using the Watson Machine Learning service. The deployed model was used in the web app via an API call, utilising the power of the cloud.

Program Code Snippet:

CREATING DEPLOYMENT SPACE

```
In [56]: def guid_from_space_name(client, space_name):
         space = client.spaces.get_details()
         return (next(item for item in space['resources'] if item['entity']['name'] == space_name)['metadata']['id'])

In [57]: space_uid = guid_from_space_name(client, 'Regression-Models')
         print("Space UID = " + space_uid)

         Space UID = a5d3879c-fce2-421a-a352-9e2bbb589332

2. Making the probabilistic prediction

This function takes in the candidate's gre score, toefl score, cgpa, sop, lor ratings and a boolean field representing whether he has prior research internship experience or not. Using the deployed multiple linear regression model, we estimate the probability of acceptance to universities having the specified rank. If the probability percentage is over 66.67 %, the candidate stands a very good chance to get addmitted to the university. Otherwise, we display “Low Chances”, implying that the candidate shouldn't apply to that particular university.

Program Code:

```
def pred(gre, toefl, sop, lor, cgpa, resc, univ_rank):

    # Preprocessing user input
    # ielts = convert toefl to ielts(toefl)

    if resc == 'Yes':
        resc = 1
    else:
        resc = 0

    payload_scoring = {"input_data": [{"field": ["GRE
Score", "TOEFL    Score", "University    Rating", "SOP", "LOR    ", "CGPA",
"Research"]],
        "values": [[gre, toefl, univ_rank, sop, lor, cgpa, resc]]}]

    response_scoring = requests.post('https://us-
south.ml.cloud.ibm.com/ml/v4/deployments/uaep deployment/predictions
```

```

?version=2022-11-12', json=payload_scoring,
    headers={'Authorization': 'Bearer ' + mltoken})

prediction =
response_scoring.json()['predictions'][0]['values'][0][0]

st.info("Chance of Admittance for University Rank " +
str(univ_rank) + " = " + str(prediction[0]*100) +" %")

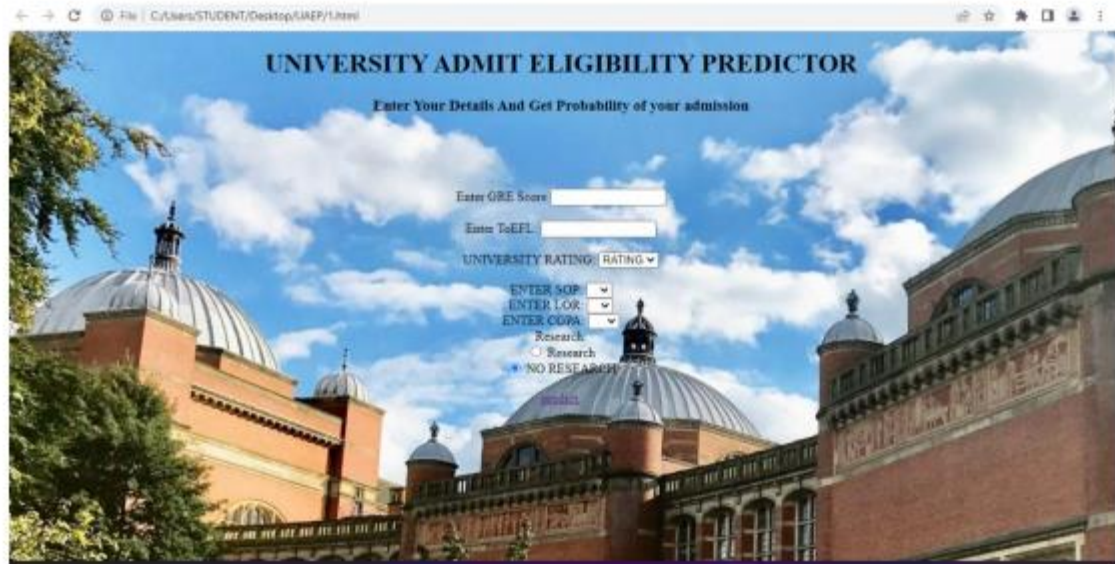

if prediction[0] >= 0.6667:
    st.success(
        'Congratulations! You are eligible to apply for this
university!')
    chance = Image.open('images/chance.png')
    st.image(chance, width=300, caption="High Chances !")
else:
    st.caption('Better Luck Next Time :)')
    no_chance = Image.open('images/noChance.jpg')
    st.image(no_chance, width=300, caption="Low Chances :(")

```

9. ADVANTAGES & DISADVANTAGES

Advantages:

- The system helps the applicant to save loads of money in the university application process by predicting the percentage chances of admit.
- The easy to use and elegant UI will attract the applicants to use the web application.
- Graphical visualizations and univariate analysis of the data will help the candidate to understand and analyse what factors play a crucial role in increasing his chances of admittance.
- The final deliverable is hosted as a web app, leveraging SaaS cloud principles that enables the end users to access the application from any convenient device.

Disadvantages:

- Since the end product is hosted in cloud as a SaaS, a stable internet connection is required.
- The current solution is hosted in a free tier cloud hosting account, which can handle a limited load. The web app may not handle the requests if the number of users increase at an exponential rate.

10. CONCLUSION

A model was developed to determine the admission of a student to the interested universities. The following parameters were taken into consideration:

- GRE Score
- TOEFL Score
- University Ranking

- SOP
- LOR
- CGPA

From the validations, we can find out that the above parameters greatly contributed in determining the “Chance of Admit” into an university. Different models - Multiple Linear Regression, Decision Tree Regression, Random Forest Regression were taken into consideration. Out of the 3 models, Multiple Linear Regression outperformed other models with a R2 score of 0.819. Hence Multiple Linear Regression was adopted in predicting the results.

This model could likely be improved by gathering additional data of students from different universities which has similar selection criteria to choose the candidates for Master’s program.

11. FUTURE SCOPE

Future Scope of the project can be as follows:

- A future update could have chat space where candidates, faculties, current students of the university and alumni can interact and candidates can get their doubts resolved instantly.
- Get in touch with grad-schools’ and professors and determine other important factors that play a key role in increasing the chances of admission.
- To deal with huge volumes of data in the future (Both - applicants and university details), cloud based storages (IBM cloud, AWS, GCP, AZURE) and NoSQL databases (MongoDB, Redis, etc.) could be used instead of the traditional RDBMS storage.
- Alternatively, distributed big-data processing techniques could be explored if the no. of users using the website increases exponentially during the course of time.
